WORKFORCE CHALLENGES

FACING MODERN ORGANIZATIONS

Organizations today face multiple workforce challenges that impact productivity, growth, and their ability to build a **future-ready workforce**.

01

Talent Acquisition Bottlenecks

Difficulty finding and hiring the right talent quickly.

02

Skills & Capability Gaps

Workforce skills not keeping up with business needs.

03

Employee Engagement & Retention

Low engagement leading to higher turnover.

04

Fragmented Systems

Disconnected tools create data silos and inefficiencies.

05

AI Readiness & Adoption

Lack of AI adoption and readiness across the organization.

Why Customer Service Breaks Down

Disconnected messages, unclear ownership, and slow follow-up create service gaps.

1

Scattered Channels

customer messages live across chats, email, calls, and forms.

2

Slow Response

teams spend time searching before they can act.

3

Unclear Ownership

cases move around without one clear responsible person.

4

Lost Feedback

complaints and suggestions are recorded but not analysed.

5

Weak Follow-up

customers wait because actions are not tracked to closure.

Demo Moment

Trace one complaint from message to owner to resolution status.

AI Prompt Moment

Summarise these open customer issues and identify urgent cases, repeated themes, and next actions.

The takeaway: service excellence needs every message, owner, and follow-up action visible in one workspace.

What Lark Brings Together

One platform to connect customer messages, service records, knowledge, meetings, follow-up actions, and AI support.

Service teams work faster when chats, forms, cases, documents, meetings, and dashboards live in the same workspace.

Automation Starts With Clean Intake

Forms reduce scattered messages by capturing the right information before work starts moving.

The diagram illustrates a three-step automation process:

- Request Form:** A form with fields for Requester (text), Request Type (dropdown), Priority (dropdown), Budget (text), Due Date (calendar), and Attachment (upload button).
- New Record:** A record card showing the captured data: Request Type (Purchase Request), Requester (Ava), Priority (High), Budget (\$5,000), Due Date (May 20, 2024), and Attachment (proposal.pdf).
- Route to Owner:** A routing step showing the record is assigned to Ben (Purchasing Lead) and a 'Routed' status indicator.

Arrows indicate the flow from the Request Form to the New Record, and then to the Route to Owner step. A dashed line with a robot icon connects the top of the New Record and Route to Owner steps.

Messy Intake

Demo Preview

Turn a repeated chat request into a form that creates a Base record automatically.

Required Fields

Ask for must-have details

Dropdowns

Standardize common answers

Attachments

Collect proof early

Auto-Routing

Send records to the right owner

Clean intake prevents automation from moving incomplete work faster.

The Core Automation Pattern

Most business workflows follow the same simple path: intake, checks, routing, approval, records, notifications, and reporting.

Demo Preview

Map one manual process into this pattern before building it in Lark.

Example: Purchase Request

Trigger

What starts the workflow?

Rules

What decides the next step?

Owner

Who must act?

Output

What record or report changes?

Once the pattern is clear, no-code tools can turn repeated work into reliable movement.

Lark Base Becomes the Operational Database

Base turns everyday business work into structured records, workflow views, automations, and dashboards.

When business data lives in Base, workflows become easier to **automate and measure**.

Approval Is the First Workflow to Digitize

Approvals are repeatable, rule-based, and high-impact, which makes them ideal for no-code automation.

Purchase

Thresholds

Route by amount or risk

Documents

Require proof before review

Escalation

Move stuck requests forward

Audit Trail

Keep every decision traceable

Digitizing approvals gives teams **faster decisions** without losing control or accountability.

Case Study: SoBanHang Automated Admin Work

A fast-growing business used Lark to move admin work from scattered manual follow-ups into connected approval and attendance workflows.

Before

- Manual admin checks
- Scattered requests
- Slow status updates

After

- Digital approval flow
- Attendance records
- Clearer management visibility

Digitize Routine Work
Start with repeatable admin tasks

Connect Approvals
Route requests without chasing

Capture Records
Keep activity visible in one place

Improve Control
Give managers cleaner oversight

Demo Preview

Recreate a simple admin approval flow with request form, approver, record, and dashboard.

The lesson: automation creates value fastest when it removes daily coordination work from managers and teams.

Project Management Needs an Operating System

Projects move faster when plans, tasks, updates, documents, approvals, risks, and dashboards live in one connected workspace.

Visibility

See project health early

Accountability

Owners and deadlines are clear

Governance

Approvals and changes are traceable

Delivery Rhythm

Teams know what happens next

Demo Preview

Build a project register that connects tasks, risks, approvals, and dashboards.

A connected PMO helps teams move from scattered updates to confident delivery decisions.

RAID Logs Turn Uncertainty Into Managed Work

Risks, assumptions, issues, and dependencies should be tracked, owned, reviewed, and escalated before they damage delivery.

Identify

Capture risks, assumptions, issues, and dependencies

Assign Owner

Make ownership clear and accountable

Set Impact

Assess severity and potential impact

Review Weekly

Keep the log current and decisions fresh

Escalate

Raise blockers to the right level

Example Prompt

Extract risks, issues, dependencies, owners, severity, and next actions from these meeting notes.

Severity

Rate impact and urgency

Ownership

Every item has an accountable owner

Mitigation

Define the next action

Escalation

Move blockers to decision-makers

Risks

Potential events that could impact objectives

Assumptions

Beliefs we rely on that may not always hold true

Issues

Problems affecting current execution

Dependencies

Work or resources we rely on from others

RAID Log

Type	Item	Owner	Impact	Due Date	Status
Risk	Vendor delay	Alex Chen	High	May 24, 2025	Mitigating
Assumption	Budget approved	Priya Nair	Medium	May 30, 2025	Watching
Issue	UAT defects	Jason Lim	High	May 22, 2025	Escalated
Dependency	API access	Mei Wong	Medium	May 28, 2025	Waiting

A RAID log is useful only when it creates action, ownership, and timely escalation.

The Core Project System

A connected PMO system tracks the journey from project idea to delivery evidence and lessons learned.

Demo Preview

Build a project register, then connect tasks, RAID, approvals, and dashboard views.

Example: System Launch

Single Register

Every project has one source record

Live Plan

Tasks and milestones stay current

Controlled Changes

Scope and budget changes are traceable

Decision Log

Key decisions stay visible

A project system works when each stage leaves a record that the next stage can use.

Lark Base Is the Project Control Center

Base can hold the project register, task tracker, RAID log, change requests, milestones, resources, and portfolio views.

PMO Project Register

Project	Owner	Phase	Health	Risk	Next Milestone
CRM Launch	Alex Chen	Execution	Green	Low	Go-Live - May 15

When the project register is live, the PMO stops chasing updates and starts managing delivery signals.

Case Study: DigiPlus Improved Project Management

A fast-moving digital business used Lark to improve team communication, project coordination, and visibility across workstreams.

Before

- ✗ Updates scattered
- ✗ Project follow-ups manual
- ✗ Leaders wait for reports

After

- ✓ Communication centralized
- ✓ Tasks tracked clearly
- ✓ Progress visible faster

Centralize Updates

Keep project communication in one place

Track Execution

Connect tasks to owners and deadlines

Surface Blockers

Make risks visible before they grow

Improve Oversight

Give leaders a clearer delivery view

Demo Preview

Recreate a project workspace with communication, task tracking, and dashboard status.

The lesson: project management improves when communication and delivery tracking work together.

Next Phase

Move forward with conditions clear

Good governance does not add bureaucracy.
It creates timely decisions with clear evidence.

PMO Becomes Stronger When Work Is Connected

The goal is not more reports. The goal is clearer decisions, faster escalation, stronger accountability, and better delivery confidence.

The PMO Delivery Loop

One Register
Projects share a single source of truth

Live RAID
Risks and blockers stay visible

Clear Governance
Approvals and changes are traceable

Better Decisions
Leaders act on current delivery signals

Next Move
Choose one active project portfolio and make its register, RAID, and decisions visible

Connected PMO work moves teams from status chasing to confident delivery management.

What Good PMO Implementation Looks Like

Start with one project register, standardize intake, add RAID, connect approvals, build dashboards, then expand to portfolio governance.

PMO Maturity Dashboard

Example Start: Active Project Portfolio

Demo Preview

Build a starter PMO workspace with project register, RAID log, and portfolio dashboard.

Owner

Assign a PMO process owner

Standard Fields

Use consistent project data

Review Cadence

Set weekly visibility rhythm

Success Metrics

Track health, risks, and decisions

The best PMO rollout starts with **visibility**, then adds **governance** where it improves decisions.
